Meet the new technology from H2O Innovation, The Antifreeze. Simple Fact: The air will get colder if it’s under vacuum. Meaning if you have leaks, air will go inside your tubing, and this air will freeze the sap. This simple tool will control the vacuum level in your tubing network, according to outside temperature.

Based on a chart that is programmed by default, stay away from freezing and get the most of your operation. The vacuum level will be controlled by a modulating valve that slowly let air in right at the pump. There is more: for 3 phases pumps with VFDs, the Antifreeze will also control the motor speed.

- Modulates vacuum according to temperature
- Pre-programmed vacuum curve for easy use
- Intuitive temperature correction by user
- Adjust at the beginning of the season and forget about it

WORKS WITH EVERY VACUUM PUMP, WITH OR WITHOUT VFDs (DRIVE)
